

COMPANY PORTFOLIO

International for Engineering Works

Integrated Water, Wastewater &
Electromechanical Solutions

Design · supply · project coordination · implementation support

Clear requirements. Coordinated systems.

Engineering work that connects the whole system

International for Engineering Works brings together technical definition, specialist supply, project coordination, and implementation support.

Our public scope extends across water and wastewater, mechanical and electromechanical works, HVAC, fire fighting, ventilation, construction, civil works, and infrastructure.

Design · 2D/3D drawings · cost estimation · project management · implementation supervision

Mechanical water-supply & purification reference · Wadi Natron

A complete project interface

The company’s public scope connects design, equipment, site work, and technical coordination across the project lifecycle.

01	02	03	04	05
Water & wastewater	Mechanical & electromechanical	HVAC, fire & ventilation	Construction & infrastructure	Project & technical support
Treatment stations, filtration, UV units, pumps, blowers, piping, and water-supply systems.	Equipment coordination, panels, piping, valves, drawings, estimation, and implementation support.	HVAC, fire-fighting, steam, ventilation, air diffusers, and related air-side components.	Construction works, civil works, infrastructure works, and site-linked coordination.	Project management, 2D/3D drawings, cost estimation, supervision, and coordination.

Our advantage is the connection between disciplines—not treating each component as an isolated purchase.

Experience that gives projects perspective

A few numbers frame the story. The work behind them is what matters.

20+

years of experience

A long view of technical work, coordination, and delivery.

50+

projects

A portfolio shaped by water, infrastructure, and electromechanical needs.

05

connected interfaces

Water, mechanical, built environment, project support, and technical coordination.

Experience becomes valuable when it is translated into clear scope, coordinated systems, and accountable project work.

From requirement to dependable delivery

A practical sequence connects engineering intent, technical definition, specialist supply, and site implementation.

01 · Understand

Clarify the application, operating conditions, interfaces, and required outcome.

02 · Design & specify

Define the system, quantities, drawings, and compatible components.

03 · Coordinate & source

Compare technical options with specialist suppliers and align the disciplines.

04 · Support implementation

Supervise, document, and coordinate delivery within the agreed scope.

Every engagement is shaped by the project requirements, approved scope, and agreed deliverables.

A focused supply ecosystem

Our supplier intelligence is organized across twelve solution domains, helping the team search, compare, and coordinate technical supply.

- | | | |
|--------------------|-----------------------|------------------------------|
| 01 Water pumps | 05 Ductile iron | 09 Covers & access systems |
| 02 Water treatment | 06 Valves | 10 Measurement & control |
| 03 Plastic piping | 07 Fire-fighting | 11 Tanks |
| 04 Steel piping | 08 HVAC & air systems | 12 Ventilation & air outlets |

This is a supply-scope taxonomy from current records—not a count of projects, clients, agencies, or certifications.

Selected water and infrastructure references

Two published references, shown at a readable scale so the work can be understood—not just displayed.

800 m³ concrete tank · Slaughter House of Shubra Shehab, Qalyubia, Egypt

1,750 m³ concrete tank · Qibli Qarun, Fayoum, Egypt

Additional published references: Hayah Karima · Sohag | Water supply and purification system · Wadi Natron

Confirm role, dates, outcomes, permissions, and final case-study wording before external circulation.

Water treatment across real operating contexts

Published references show how water-treatment work adapts to agricultural, institutional, and infrastructure environments.

East Owinat Farm

Sewage-treatment and potable-water purification station for a potato-seed chiller project; 64-ton refers to the chiller project context.

Marbel Institute · Bani Swif

Water-treatment and sewage-treatment references published by Infeworks for an institutional setting.

Toshka · East Owainat

Water-treatment and sewage-treatment references associated with agricultural development contexts.

Published references shown as listed; confirm role, date, outcome, and permission before issuing a formal case study.

Sewage treatment for industrial and agricultural needs

Industrial sewage reference · Slaughter House of Shubra Shehab, Qalyubia

Cattle-parlor treatment reference · Sadat, El Hamam, Wadi Natron and Yashaa

Treatment designed around the setting

The published references cover industrial sewage, agricultural facilities, cattle-parlor applications, and combined potable-water purification and sewage treatment.

That range matters because treatment systems are shaped by the source, the operating environment, the required water quality, and the interfaces around the installation.

Published reference set

Shubra Shehab · Marbel Institute · Toshka · East Owinat Farm · Animal Production Complex

Confirm role, dates, outcomes, permissions, and final case-study wording before external circulation.

Evidence-led engineering, not empty claims

The strongest story is visible in the work itself: equipment details, pump sets, water systems, site conditions, and the coordination required to bring them together.

We present information with clear boundaries—what is documented, what was supplied or supervised, and what still requires confirmation.

Clear source · clear scope · clear permission

Hayah Karima · Sohag reference · image published on the official website

The way we work

A professional process is measured by how clearly it supports the decision—not by how loudly it describes itself.

01

Clarity before commitment

We define the requirement before recommending a product or system.

02

Fit before volume

We match specifications, operating conditions, and application—not just a brand name.

03

Coordination across disciplines

Water, mechanical, ventilation, fire protection, electrical, civil, and infrastructure needs are connected.

04

Traceable information

Supplier and source information is organized so that decisions can be reviewed and improved.

Technical attention becomes valuable when it is translated into practical coordination.

People make the system work

“Many parts bring a company together. We believe that our greatest strength and most valuable resource is our people –those who dare to dream and do things uniquely different.”

Eng. Houssien Derbaze

Chairman

Our role is to combine technical attention with practical coordination, from the first requirement to the final delivery.

Built for owners, contractors and technical teams

We support organizations that need a clear route from engineering requirement to sourced component, coordinated system, and implementation support.

01

Owners

A clearer view of the technical scope, the required systems, and the supply path supporting the project.

02

Contractors

Coordinated components, specialist supply options, and technical support aligned with execution needs.

03

Technical teams

A practical interface between specifications, equipment, drawings, site conditions, and implementation support.

Client names, supplier logos, testimonials, and project outcomes should appear only after the relevant relationship and public-use approvals are recorded.
